

# MOUNT RONAN

## WHITE SUFFOLKS & MATERNALS

*Specialising in the breeding of elite quality prime rams*

TWENTY FIRST ANNUAL  
RAM SALE

**Tuesday 26th September 2017**

**On-property at York  
Commencing at 1.00pm**

Inspections from 11.00am.  
BBQ lunch and refreshments provided

---

**80 WHITE SUFFOLK RAMS 80**  
**80 MATERNAL RAMS 80**

**SPECIALLY SELECTED FLOCK RAMS**

---

**ACCREDITED BRUCELLOSIS FREE FLOCK No. OV/AC/044**

**Typical Mount Ronan sale rams – world class profit genetics in an athletic package.**

***"The profitability of our producers' prime lamb enterprises is the key to the future of Mount Ronan."***

# **WELCOME TO MOUNT RONAN.....**

It's been a mongrel of a season here at Mount Ronan and I appreciate that you have all endured the same circumstances right around WA. On the positive side, however, dams are pretty full and sheep and wool prices are extremely buoyant.

The outlook for the prime lamb industry is particularly rosy. It was recently described as the "darling industry of agriculture" (Mercado, WA Farmers Conference 2017) because of its predicted prospects.

Feedback from producers and agents has been absolutely outstanding and we are expecting the breeding program to keep delivering the same rate of gain we have achieved over the last few years..... This is our challenge and our responsibility to our producers.

Buyers can purchase with confidence knowing that the rams all possess a wonderful balance of growth and muscle ASBVs and an acceptable range of genetic fat to suit mating combinations and finishing systems.

Joanne and I hope that you successfully purchase your ram preferences, and we will follow up with after-sales service as usual. Good luck.

## **What is the Mount Ronan breeding program all about?**

The Mount Ronan breeding program is aimed "fairly and squarely" at maximising producers' lamb enterprise profitability. The difference between our breeding program and most others is that we have always placed a much greater breeding value on ewes than rams. I truly believe that the greatest rate of genetic gain is made by a detailed study and observation of female type and performance. This view is supported by investigation into cellular physiology at a mitochondrial level. The mitochondria are the power stations of the living cells.

The identification of those truly proven-elite ewes in our flock which possess outstanding production genes is our focus. We select sons of these ewes to spread their genes widely throughout the flock, and we also introduce new genetics via these ewes. If they are artificially inseminated to new-blood rams and the progeny are less than outstanding performers, then we know that those rams are simply not good enough for our purposes.

The use of outside genetics is essential for genetic diversity, and also helps with genetic linkages on Lambplan and greater accuracy of ASBVs.

We used 8 ram lambs for the 2017 crop of lambs with consistently good results. We have retained all of these rams for the time being while we await DNA information.

We embryo flushed 5 of our top performing ewes and implanted 50 embryos. A total of 42 lambs have been marked.

We will definitely be using several of these ram lambs in the next mating program in February.

Some of the ET ram lambs produced last year are included in this sale.

# MOUNT RONAN GENETICS IN ACTION

Some of Andrew and Jane Hunter's Mount Ronan Maternal bloodline blue tag ewes (in the background) which marked 171% off a scrub block.

(Andrew and Jane Hunter, "Hills Park", Yerong Creek NSW).

Well grown Dohne ewe lambs with offspring sired by Mount Ronan White Suffolk rams.

(Brian and Joan Trundle, Kulin. August 2017)

"Not bad for this shitty season"  
(Charlotte Fisher).  
Marking lambs at Eulo Grazing,  
Kojonup, 13 July 2017.

Beautiful healthy Maternal  
lambs considering the  
abominable season.

## **THIS YEAR'S SALE OFFERING**

The rams we are offering at our 21<sup>st</sup> on-property sale have had mixed blessings. Last season was wonderful and this year's season has been abominable. They have worked hard on poor pasture since the proper break of the season.

The red clover virus killed all the clover on our property and around the district, and as a result we commenced trail feeding some pellets to the rams three weeks before sale date to boost protein intake a bit.

The rams we are offering to producers are fit and athletic, and ready to go to work. We are really satisfied as we can again offer a line of rams with a positive ASBV production balance. In other words, positive growth with positive muscling. There is some variation in genetic fat levels for producers chasing extra yield for later maturity lamb finishing systems.

Generally however, our genetic offering targets the production of prime lambs with high early growth to heavy weights. The genetic balance between early growth, fat and muscling is the key for a profitable enterprise, combined with outstanding mothering attributes, constitutional strength and excellent producer management.

Our flock is accredited Brucellosis free (OVAC 44), and all rams have received Glanvac B12 6in 1, Eryvac and Scabby Mouth vaccinations, as well as Cobalt and Selenium bullets.

In addition, the rams have been vaccinated for OJD, which accounts for the horrible lumps on some of their necks.

This is being done as insurance against the possibility of a false positive diagnosis during abattoir surveillance. Such an occurrence would be catastrophic for our business.

We anticipate that these rams will continue to uphold the wonderful reputation of Mount Ronan genetics.... a reputation forged over decades for outstanding commercial performance and constitutional strength.

## **Breeding for enhanced worm resistance**

Worm resistance is highly heritable. We have run our flock at Mount Ronan under hard commercial conditions for nearly 50 years, and we have an exceptionally resilient sheep genotype. Our genetics are performing beyond industry expectations in higher rainfall environments in Western Australia and in the Eastern States.

We are using high worm resistant sires by preference, and have been DNA testing our new young sires for a range of genetic traits, including resistance to worms. The testing confirms that our sheep are generally genetically able to perform well in wormy environments.

However, over the next couple of years, information available to producers on worm resistance will be much more readily available in the catalogue.

2017 drop ET lambs with their recipient mothers. Some of these ram lambs will be available for purchase at the 30th January 2018 sale at Mount Ronan.

## **Long history of production genetics**

My concept of the ideal meat sheep has not changed over the last 50 years. The heavily-muscled, fast-growing, medium-legged animal with smooth shoulders, a long deep barrel, width across the loins and area in the hind quarters, has always been the Mount Ronan type. Coupled with this is selection for hardiness and mothering ability .... females which lamb easily and grow lambs quickly..... females which can count to at least three and nourish multiple offspring.

The transition from a breeding program producing specialist terminal/meat genetics to one including specialist maternal/mothering genetics has been a very simple one for Mount Ronan. All those decades of selection for mothering ability, temperament and maternal performance has resulted in terminal ewes which are exceptional maternals as well.

When the dedicated Maternal program was initiated in 2003, we introduced the best available maternal genetics from Australia and New Zealand. We found some outstanding individual sheep, but generally a lot of the introduced stock was weeded out pretty quickly. They simply "lacked grunt", and essentially all of them were deficient mothers compared to our home-bred ewes.

It was the infusion of the hardy, high-performance Mount Ronan White Suffolk genetics which, when incorporated into the foundation stock, had the greatest impact on production. Most Mount Ronan Maternals have at least 50% Mount Ronan White Suffolk genetics in their makeup.

We have selectively introduced New Zealand maternal genetics into our program over more recent years but have found them to be lacking in grunt generally. After a couple of "run throughs" of the White Suffolk flock, they begin to harden up constitutionally.

**The 'grunt gene' remains King at Mount Ronan !!.....  
.....that's the Mount Ronan trademark.**

The type of sheep we are breeding now are the type of sheep we have always produced..... it's just that we are continuing to identify those truly outstanding animals which provide the extra genetic boost in performance with consequent higher levels of profitability per hectare.

Our identification and utilisation of those outstandingly efficient females will be intensified. We have now developed the measurement tools to enable us to identify them more easily. We will continue to embryo flush the proven elite ewes and concentrate on breeding from their top sons and daughters.

The hardy Mount Ronan White Suffolk genetics powers our Maternal program. These genetics go back directly to the outstanding Suffolk flock I founded in 1969.

2006 drop White Suffolk lambs at Mount Ronan. Muscular, growthy, high-yielding genetics have always been the focus over the decades.

The truly extraordinary 10 year old White Suffolk flush ewe, Mount Ronan 070793. No sons in the catalogue this year due to the poor embryo "stick" rate last season. This ewe has produced 9 marked ET lambs this year. Some sons may be available in the January sale. Pictured with her backup lamb after the ET program (scanned twins, but one was reabsorbed).

# WHITE SUFFOLK PROGRAM STILL TOP SHELF

The table below shows the progress of Mount Ronan terminal flock ASBVs in the last decade, compared with the average of all LAMBPLAN (SGA) measured White Suffolk flocks in Australia (Terminal 23).

There is an immense difference between the average muscle ASBV (Pemd) of the Mount Ronan White Suffolk flock and that of the average White Suffolk flock in Australia.

Mount Ronan White Suffolk sheep have always been far more muscular than the average White Suffolk sheep on LAMBPLAN in Australia, and the flock has always possessed higher than average growth-rate genetics.

As a result of these factors, and because Mount Ronan birth weight genetics are below average, lambs sired by Mount Ronan rams are generally born easily and grow muscle mass very quickly. This greatly reduces time to slaughter and results in increased carcase yield.

The average Pfat ASBV for the Mount Ronan White Suffolk flock is ideal to cater for matings with Merino or Maternal ewes.

Above: Comparison between the average eye muscle depth of the White Suffolk flock on LAMBPLAN and the average eye muscle depth of the MOUNT RONAN White Suffolk flock on LAMBPLAN.

Above: Comparison of MOUNT RONAN LEQ Index with the White Suffolk LAMBPLAN tested breed average.

Terminal - 23							
	Bwt	Wwt	Pwwt	Pfat	Pemd	LEQ	Carcase+
2008	0.25	6.18	9.60	-0.57	0.45	120.4	155.4
2009	0.26	6.52	10.11	-0.57	0.52	121.9	158.7

2013	0.29	7.85	12.19	-0.54	0.95	126.7	174.0
2014	0.29	8.20	12.72	-0.53	1.12	128.3	178.4
2015	0.29	8.48	13.18	-0.51	1.25	129.6	182.2
2016	0.29	8.82	13.73	-0.47	1.41	131.5	186.6

MOUNT RONAN 23-0090							
	Bwt	Wwt	Pwwt	Pfat	Pemd	LEQ	Carcase+
2008	0.22	6.77	10.43	-0.81	1.25	121.4	169.8
2009	0.20	7.00	10.93	-0.77	1.46	122.9	174.3
2010	0.20	7.04	10.91	-0.73	1.40	123.4	173.6
2011	0.25	7.39	11.51	-0.59	1.55	126.0	177.5
2012	0.18	7.61	12.07	-0.51	1.81	129.0	182.6
2013	0.23	7.78	12.24	-0.38	2.14	133.0	186.8
2014	0.24	8.23	12.91	-0.42	2.29	134.9	192.1
2015	0.29	8.74	13.60	-0.45	2.28	135.7	195.8
2016	0.23	8.75	13.81	-0.27	2.41	136.4	197.1

Using the power of Mount Ronan genetics will put more money in your wallet ...

**The accuracies of the ASBVs are extremely high because Mount Ronan has measured more sheep on LAMBPLAN than most other stud flocks in Australia.....and**

**The ASBV's of the Mount Ronan White Suffolk flock are impressive compared to the average ASBVs of all the White Suffolk flocks that are recorded on LAMBPLAN, particularly because the ASBV lines are so well balanced.**

	BWT	WWT	PWWT	PFAT	PEMD	LEQ
Mount Ronan average	0.23	8.75	13.81	-0.27	2.41	136.4
White Suffolk average	0.29	8.82	13.73	-0.47	1.41	131.5

## **SO WHAT'S THE DIFFERENCE BETWEEN OUR MATERNALS AND OUR WHITE SUFFOLK SHEEP?**

The breeding objectives for our White Suffolks and Maternals are heading in the same direction really. The two "types" of sheep we are producing are becoming pretty interchangeable and that is a great advantage for us as well as for our producers. We have significantly increased the diversity of the gene pool, improved type stabilisation and created significant linkages between the Terminal and Maternal datasets on Lambplan. This will improve ASBV accuracies over time.

Perhaps the main differences between the two breeding programs at the moment is that we are concentrating on muscling up the Maternals and adding more 'grunt' genes, plus a bit more fat and a bit more fertility. We have been shifting our focus towards higher early growth over the last few years in both programs and we have also raised genetic fat levels in the White Suffolk flock to complement the 100-day growth focus.

**Whether the ewe lambs are from Mount Ronan White Suffolk or Mount Ronan Maternal rams, they are ideally suited for use in a self-replacing lamb breeding flock.....so start collecting them immediately!!!**

Our recent, critical innovation, as I mentioned before, is the identification of the most genetically efficient ewes in both flocks and our greatest genetic gains will result from better use of these outstanding sheep.

## **NEW LAMBPLAN INDICES**

For our White Suffolk catalogue we are listing the **LAMB 2020** index for each ram. We are no longer using the **Carcase Plus** index as we believe it is not going to result in the best profit/hectare outcome for purchasing producers.

The **LAMB 2020** index has its emphasis on early growth to weaning and post-weaning and penalises excessive fatness or leanness. It includes birth weight, improved parasite resistance and muscling. This index is ideal for producing 20 – 24kg carcasses.

We have introduced the new **LAMB 2020 Eating Quality** index (**LEQ**) to the catalogue this year. We will use this index to assist in decision making in our breeding program. The **LEQ** index is targeted at terminal producers who are interested in improving the meat quality of their prime lambs, while continuing to improve production traits in a balanced way. Even though no processor is currently paying a premium for meat eating quality, we want to know that our breeding program is producing the product the consumer would enjoy eating.

For Maternals, we prefer the recently released **Maternal Carcase Plus** index (**MCP+**) to the previously utilised **Maternal \$** index, as we consider it will generate a more profitable self-replacing lamb production system for producers. The **MCP+** index rewards a capped adult weight, increased early growth rate, increased eye muscle depth, better worm resistance and improving fertility. It only slightly rewards increasing clean fleece weight.

When selecting rams for breeding programs, buyers need to pay special attention to the ASBV's in order to choose the most appropriate ram for their individual enterprise. Indices are simply a guide for selection.

## **LAMBPLAN'S TRAIT LEADERS**

Many of our sale rams are trait leaders. In other words, they are in the top 10% of the LAMBPLAN database for growth, leanness, muscling, or a combination of these traits. They are in the top 10% of all the rams of all breeds measured in the LAMBPLAN program in 2016 in Australia and New Zealand.

**Trait leaders are noted in the comments for each ram and boxes are shaded to make them more visible.**

## MOTHERING SCORE

When the ewes are lambing at Mount Ronan, we birth weigh the lambs, tag them and record their pedigree information. Any positive or negative observations are recorded, and each ewe is given a mothering score.

This score is derived from a combination of characteristics. Lamb awareness, especially with multiples, quietness, and lack of concern for human intervention help derive the score.

All ewes are scored the same way, and the White Suffolk and Maternal ewes are run together in the same flocks. Consequently the mothering scores for dams of White Suffolk rams can be directly compared with those for Maternal rams..... unlike all the ASBVs.

An **MS10** ewe will stand next to you when you weigh and tag the lambs. She may sniff you and the lambs and even take time out to nip a bit of pasture while she waits for you to finish weighing and tagging the lambs. She is quite relaxed, but totally aware of the lambs at the same time.

An **MS9** ewe is pretty relaxed about the whole procedure, but only approaches to a distance of about one to three metres. She is completely aware of the lambs and returns immediately after you back away.

An **MS8** ewe walks back and forwards, or stands more than three metres away. She returns immediately when you back away, and is totally lamb aware during the whole procedure.

An **MS7** ewe may circle five to fifteen metres away from you, and is less lamb aware. She may go looking for her lambs near another ewe, but will return immediately once she has "regained her bearings". She will re-mother the lambs immediately.

**MS7** is the lowest scoring ewe we consider keeping in our flock, though she will perform extremely well in all commercial prime lamb operations. We don't find many ewes with score seven characteristics any more, even in the ewe lamb flock.

**Note:** If ewes have freshly lambed, they will tend to score higher because they are in a more protective mode. As time after lambing increases they will score lower, as they realise that the lambs are ready to move away with them from the birth site.

Each year a ewe's score may change slightly depending on circumstances.

**But generally, an outstanding mother is always an outstanding mother.**

An **MS10** ewe at lamb tagging time, 2013.  
This ewe produced natural triplets in 2014.

One-year-old ewe lambs with twin newborns at Mount Ronan. World class mothering genetics in action.  
(26 August 2014)

## MATING EWE LAMBS

In the White Suffolk catalogue we have commented on ram suitability for mating with ewe lambs. Whilst we know that the majority of our rams would produce easily-lambed offspring from ewe lambs, producers can purchase the recommended rams with more confidence. The rams highlighted generally have lower birthweight genetics, and come from sires with a genetic history of lambing ease.

**Historically, our Maternal rams have demonstrated easy birthing in ewe lamb flocks. Consequently, we felt it was unnecessary to provide recommendations. If producers are concerned that their ewe lambs may not be well grown enough, or lack easy-lambing genetics, we advise them to select Maternal rams with lower birthweight figures.**

# **EWE EFFICIENCY INDEX**

We have put a lot of time this year into improving and refining our ewe efficiency index and it continues to be a work in progress.

We are working to generate individual standard reference weights (SRWs) for our ewes, which is an estimate of their live weight at condition score 3. We aim to use SRW in the calculation of ewe efficiency, rather than joining weight, to remove the penalty towards ewes that are heavier because they are in better condition at joining.

At this stage, we do not have an accurate SRW for every ewe in our flock. Therefore, the ewe efficiency indices reported in the catalogue are based on the ewes' joining weights.

However, this year, the ewe efficiency indices reported are not only for the 2016 lambing, but an average of all lambings from 2013-2016. This provides a much stronger indication of the ewes' lifetime performances, and better identification of the elite ewes.

The ewe efficiency index reported in this catalogue is calculated as follows:

$$\frac{\text{average kg lamb weaned at 100 days}}{\text{average ewe joining weight}}$$

A part of the Ewe Efficiency Index can be attributed to the performance of the sire, as the lamb's growth etc are a combination of the sire and the dam. However, in the future we expect to be able to isolate the genetics of ewe efficiency in the same way that any other attribute is assessed via the LAMBPLAN program.

## **SOME THINGS TO REMEMBER ABOUT THIS RATING:**

- Triplet-bearing ewes will score higher if they have the ability to raise all their lambs and grow them well in the first 100 days after lambing
- Twin bearers can wean 100% of their mating weight in 100 days if they are very efficient performers
- Single bearers will usually be unable to produce 100% of their own mating weight of lamb in 100 days. To do so would be a truly amazing performance
- Spring lambers often score lower because they have a shorter period on green feed. Despite lambing later, however, some ewe lambs may have a very high efficiency because of their immature body weight at the time of mating. Old ewes are also penalised because their production efficiency reduces with age.
- We are searching for ewes with a genetically reduced mating weight that have the ability to pump out maximum kilograms in the first 100 days after lambing. We are establishing the "sweet spot" for ideal mating weight genetics. This ongoing research in the Mount Ronan breeding program will deliver us valuable SRW (Standard Reference Weight) information
- **Our ewe efficiency research will eventually result in the provision of a very accurate Ewe Efficiency Index which will enable professional lamb producers to really focus on the selection of outstanding profit-maximising genetics**

A breeding ewe at Mount Ronan, August 2016.

# **NEW INITIATIVES IN 2017 - 2018**

## **WOOL MEASUREMENTS**

This year we have fibre tested and fleece weighed our Maternal sale rams.

We consider the MCP+ index to be the most appropriate one to assist our breeding selection and recommend it to our producers. The MCP+ index includes wool traits and it is therefore useful to include these as an extra assist in sire selection.

The main objective of the extra data collection is that we can then tailor any gains we wish to make over time for any wool traits we consider to be important.

As with all other traits such as growth, muscle, leanness and fertility, we are able to apply selection pressure in percentage terms. For example, we can apply a higher rate of selection pressure for micron reduction and a lower selection pressure on fleece weight. At this stage, we believe that reduction of micron will be more beneficial for self replacing flocks than fleece weight; however we have the option of altering the balance of traits at any time we choose.

We know that we can provide producers with animals with better wool characteristics without adversely affecting carcase and production performance if we use the same, careful breeding strategies we have employed over the previous sheep generations.

Make no mistake, however, selection for carcase production will remain paramount.

It is going to be another exciting challenge and we are really looking forward to it.

## **MOUNT RONAN PRIME LAMB PRODUCER GROUP EID PROJECT**

A new initiative for 2018 will be the commencement of an EID project for our producers.

The use of electronic identification in the sheep industry is not a new technology by any means, but its application to really maximise enterprise management and profitability is extremely relevant today.

We will be holding a producer workshop at Mount Ronan in the first week of February 2018 to outline the procedures and advantages of this "new technology".

Our daughter Elise has been working with producers in the Eastern States to trial applications for this technology and will be attending this workshop.

We encourage all of our producers to attend this workshop, whether they wish to be directly involved in the project or simply wish to be an observer. It is our intention to hold several follow-up workshop sessions during the course of the year.

## **FARM VISITS**

Whilst contact with clients has always been a priority for us, being able to actually visit producers in their own environment has been the most beneficial from a feedback perspective.

We employed a professional shepherd for the lambing season this year to carry out the majority of the birth recording and birth weighing of lambs. Mark is a wonderful operator, and this has allowed me more time to get off the property and visit producers.

We look forward to visiting YOU in the future.

### **Please note:**

Mount Ronan stipulates that all rams which are to be registered and transferred into stud flocks will require a total payment of \$2500 (excluding GST).

If rams are purchased at the auction for less than \$2500 and the buyer wishes to have the rams transferred and registered for stud use, then the purchaser will be required to make up the difference between the purchased price and \$2500 (plus GST) before the transfer and registration can take place.

## Understanding LAMBPLAN ASBVs

Rams with lower ASBVs for birth weight (BWT) produce lambs with lower birth weight. Both low (lamb survival) and high (lambing difficulties) birth weights should be avoided.

Rams with more positive ASBVs for post weaning weight (PWT) produce lambs that grow quicker and reach target weights in a shorter time. This ram will produce lambs that are, on average, 3kg heavier at post weaning age (7.5 months) than a ram with an ASBV of 0.

Worm egg count (WEC) ASBVs estimate an animal's genetic potential for worm burdens. Lower WEC ASBVs are desirable. This ram will, on average, sire progeny that will have 5% fewer eggs/gram than a ram with an ASBV of 0.

Trait	BWT (kg)	WWT (kg)	PWT (kg)	PFAT (mm)	PEMD (mm)	WEC (%)	INDEX
ASBV	0.3	4	6.0	-1.5	1.0	-10	150
Acc	43	63	71	59	69	37	

Rams with a more positive ASBV for weaning weight (WWT) will, on average, produce lambs that grow quicker to weaning. This ram will produce lambs that are 2kg heavier than a ram with a 0 ASBV for WWT.

Rams with a more negative ASBV for post weaning fat (PFAT) will produce lambs that are leaner, at the same weight. This ram will produce lambs that are, on average, 0.75mm leaner at the GR site when compared to a ram with a FAT ASBV of 0.

Rams with more positive ASBVs for post weaning eye muscle depth (PEMD) produce lambs that have more muscle, independent of weight, and a higher lean meat yield. This ram will produce lambs that have, on average, a 0.5mm deeper eye muscle than a ram with a 0 EMD ASBV.

An index is a guide to the value of a ram for a particular market. Rams with higher indexes will produce lambs that are more suited to that particular market target. It is important to understand what market the index applies to before using an index.

• An ASBV of 0 is the average of the 1990 drop.

• Note: A useful rule of thumb for converting ram ASBVs into lamb production differences is to simply halve the ASBV (as rams contribute half the genetics of the lamb).

• Accuracy - published as a percentage, is a reflection of the amount of effective information that is available to calculate the ASBV. All ASBVs are now published with accuracies. The higher the percentage, the closer the ASBV is to the true breeding value of the animal. Breeding values without accuracies are Flock Breeding Values (FBVs) and can only be compared within the flock.

# **WHITE SUFFOLK TERMINAL SIRE REFERENCES**

(With ASBV's as at 1/09/2017)

**NLW Explanation.** This ASBV is expressed as a percentage. (NLW%) Rams with a more positive NLW% ASBV will generally sire daughters that wean a higher percentage of lambs. The accuracy of NLW% is not high, and heritability is low, so producers should still use it as a guide only at this stage.

## **MOUNT RONAN 130074**

# Extended Bowen Family – “Team Mount Ronan”

Mark Francis shearing the sale rams, August 2017.

Mark from England – our first professional shepherd. Enjoyed being here so much, he came back for a second season of lambing.

Rotary Exchange student Joao, from Brazil, checking out how we do things in WA. Ride ‘em cowboy!

Pauline from Germany. Here to spend 3 months!

Mikel and Iker from Spain, with Joanne.

Elisa from Germany, Nune from Thailand, and Lena from Germany, were all busy helping sort ewes.

Hannah had the opportunity to check out sheep in Greece recently!

Elise lives in Wagga Wagga and runs her business, *Sheep Data Management*.

Guy marking ewes to indicate singles, twins or triplets.

Liam getting a driving lesson from Madison.

Kirby, Madison and Reg checking out the sheep.
